

Qualified Custom Demo Enablement Guide

📞 For questions or issues you encounter as you work through this process please reach out to the Qualified team in the [🔒 プライベートチャンネル](#) or [🔒 プライベートチャンネル](#) slack channels.

Intro: What This Guide Covers

This guide will walk you through the process of setting up your own personal Qualified demo account and delivering a polished 15–20 minute custom demo tailored to a prospect's website, branding, and use case.

The Guide is broken out into three parts:

Part 1: [SE Custom Demo Account Setup](#) (how to set up your own personal Qualified demo org)

Part 2: [Custom Demo Build Process](#) (the steps to prepare a custom demonstration)

Part 3: [Custom Demo Script and Flow](#)

PART 1: SE CUSTOM DEMO ACCOUNT SETUP

Each SE will have their own unique Qualified demo account that they use for custom demos. This section will walk you through the initial steps required to activate, configure, and populate your demo org so you can use it to build and deliver your demos. It is designed to be self-guided with detailed instructions and how-to videos, but make note of any challenges you run into.

1 Step 1: General Account Setup **1**

- First, ensure that you have been provisioned a Qualified environment. This will be your own personal Qualified demo org for custom demos.
 - If you need to request a demo org, use the `/QLFD Demo Org Request` command in any Slack channel or click [here](#) to kick off the workflow.
- Once you've had an org provisioned, go to qualified.com/sign-in and click Reset Password. Make sure

you use the following email format when requesting a reset: alias+qualifieddemo@salesforce.com.

- Click the link in the password reset email and create your password. Remember, your login will be something other than your standard email address like ldouglas+qualifieddemo@salesforce.com so make sure you save your credentials!
- Once logged in, go to **Settings > Me > My Profile**, and add a Profile Picture, Name, Job Title, Timezone, & Preferred Language.

2 Step 2: Configure Key Integrations 2

Now let's integrate a few relevant GTM systems into your Qualified demo org. Follow the steps below to connect each system.

Connect to Google Calendar:

This integration is required for showing Qualified's seamless meeting booking capabilities.

- Go to **Settings > Me > Calendar** and Connect your Salesforce Google Calendar to your Qualified account.
- Don't worry about connecting to Google Meet since we won't actually be booking meetings.
- Set your availability to something like weekdays, 8am-5pm, minimum meeting notice none and buffer time none. This is in order to maximize availability and have meeting times populate reliably in your demos. You won't actually be booking meetings.

Connect to Salesforce (Sales Cloud):

This integration is vital for showing how Qualified can read Lead, Contact, and Account data from Salesforce, as well as write back to Salesforce with field updates, activity logs, etc.

- In **Settings > Integrations > Salesforce > Connection**, Connect a demo **Salesforce** instance to your Qualified account (This can be a shared instance, and a sandbox instance works fine. Do not connect to a production or like Org62.)
 - Connect the Org-level account first, then personal. You may need to click "Use Custom Domain." It's best if the integration user has Admin rights, and you can use the same login credentials for both the org level account and your personal account.
- For more detailed guidance, check out this [Qualified University article](#). (You may need to create a login to access University)
- *NOTE: in **Settings > Integrations > Salesforce**, you'll see the option to do **Lead Mapping** and **Contact Mapping**, we'll come back to this after you've configured your Fields in step 3 (see below).

Connect to Clearbit:

Qualified provides all customers with access to Clearbit. Clearbit helps with things like Reverse IP lookup (to de-anonymize website visitors by identifying their company based on IP address) and Enrichment (once a lead's email is captured, pulling in additional firmographic data like company name, industry, employee count, etc.).

- In **Settings > Integrations > Clearbit**, connect to Clearbit using this key:
sk_0b79f3fb3d55b927fda6a10c82d96bad
- Make sure Enrichment and Reveal are both toggled on

- Set confidence level to High

3 Step 3: Configure your Fields in Qualified 3

With Salesforce and Pardot integrations in place, you're ready to create and define **Fields** in Qualified. Fields in Qualified define the data that Piper can collect, store, and use about site visitors, leads, contacts, and accounts. They also help enable personalization, segmentation, routing, CRM syncing, and reporting by ensuring the right information is captured and available throughout the buyer journey. They are a critical element of what makes Qualified powerful, and how we use the data available to us.

- Go to **App Settings > Fields**, and define the various Fields that you want displayed and used within your Qualified demo org. Good examples are Name, Email, Job Title, Company, Industry, Employee Count, UTM Term, UTM Source. You will likely add more Fields over time as you demo to various types of prospects with various qualification criteria, etc.
- ✨ Closely follow the guidance in this [overview video of Configuring Fields](#) to execute this step ✨

IMPORTANT: As noted in the video, for the **Name** and **Company** fields, make sure you've checked the boxes for **AI usage**. See below for example on Company field. This allows Piper to mention these fields in conversations and emails.

AI usage

Define how this field should be interpreted and whether it should be available to your AI SDR for personalization and knowledge

- ☐ This field represents account-level data
- ☒ Can mention in messenger
- ☐ Only mention this field for known Qualified leads
- ☒ Can mention in email

Salesforce Field Mapping:

Once you've set up your Fields, it's time to go back to your **Salesforce Integration settings** and fill out the **"Lead/Contact/Prospect mapping"** and **"Field Layout"** tabs. Lead and Contact Mapping allows administrators to define exactly how data collected in Qualified maps to Salesforce Lead and Contact fields. This ensures newly created or updated records are accurate, consistent with your CRM data model, and compatible with your organization's Salesforce validation rules, automation, reporting, and business processes.

- The prospect mapping and field layout is ultimately up to you and what you think will be most impactful for your demos and you can adjust this over time if needed. No need to get too elaborate.
- Below is an example of Lead mapping you can mirror.

Define the field mappings to be used each time Qualified syncs to Salesforce.

Salesforce Field	Value	Default
Company*	Company	Unknown
Full Name*	Name	Unknown
Status*	Status	New
Email	Email	Unknown
Most Recent Lead So...	Default value	Website
Title	Job Title	Unknown

4 Step 4: Set up Meetings & Routing 4

Now it's time to set up Meetings and Routing Rules in Qualified. This will ensure that buyers can instantly book the right type of meeting with the right representative, reducing manual coordination and creating a seamless scheduling experience.

- First go to **Meetings > Meeting Types** and set up a few different meeting types. Here are some examples of possible meeting types:
 - Discovery Meeting (30 minutes)
 - Solution Demo (60 minutes)
 - Pricing Call (60 minutes)
- Fill in the required fields for each meeting type as you create them.
- **! IMPORTANT: Two meeting settings to confirm:**
 - Under Routing Rules select Default
 - Under Meeting link sharing select Allow direct meeting link sharing and Allow booking using routing rules via link. This allows Piper to share these meeting links in her emails.

Now, in **Settings > Meetings > Routing**, let's create a Routing Rule for meeting booking. Qualified can support very complex and robust routing rules based on SFDC ownership, territory models, etc. as needed, but for your demo org we'll create a simple rule that ensures all meetings get routed to you.

- Within the top Rule Set, edit the Default rule so that all meetings route to you, as shown in the screenshot below. Ensure the default routing rule is toggled ON.

Default

☐ If the visitor clicked through a Outreach email during this session

☐ Schedule with Salesforce owner

Book with the following

Any repsMultiple reps

Book with a single rep or a rep selected from a queue.

 Jessica Montoya

+ Add fallback

You'll also want to create a basic **Conversations routing rule** in the same way (**Settings > Conversations > Routing**), routing all conversations to you. These are used for routing live chat conversations to the correct rep (rarely used anymore, but still available).

5 Step 5: Configure Agent Studio 5

Agent Studio is the central workspace where you configure Piper's knowledge, behavior, and objectives. It's where you teach Piper about your business, define how she should interact with buyers, and optimize her performance over time.

Go to **Settings > Agent Studio**, and configure each tab listed below.

✨ This [overview video](#) will be helpful as you work through each section. ✨

Agent Profile tab: Configure Piper's identity, appearance, and tone.

- Add Agent name (such as Piper) & Job title (such as AI SDR)
- Select an avatar image, face, & voice
- **Heads Up! NOTE:** The video above says not to connect and email account, but please **go ahead and add an email account to your Connected accounts**. This will allow you to send demo emails to yourself. This can simply be your Salesforce Gmail, or you can set up a new specific Gmail account for Piper to send your demo emails from.

Content tab: This is where you provide Piper with the knowledge needed to answer questions and educate leads about your company, products, and services.

- For each demo you give, you'll crawl relevant sections of that website for your demo. If using Informatica as an example, I'd suggest the following:
 - <https://www.informatica.com/products>
 - <https://www.informatica.com/solutions>
 - <https://www.informatica.com/use-cases>
 - <https://www.informatica.com/departments>
 - <https://www.informatica.com/customer-success-stories>
 - Make sure you select "The above url and its subpages".
 - This creates Piper's knowledge base for answering questions, drafting emails, etc. This will be something you do for each custom demo.
- Also in the Content tab, you can upload an Image. Think of this as a single slide that Piper can share during a conversation when a relevant question is asked.
 - After adding an Image, make sure you click Enable for AI use.

Guides tab: (skip this for now until after Goals)

Goals tab: This is where you define the objectives and outcomes that Piper should work toward, such as qualifying buyers, booking meetings, or collecting information.

- First create a **Meeting Booking** goal
 - Create a new blank goal and title it Meeting Booking
 - Click the + sign beneath **Ask for email address**, and select **AI Branch**.
 - Using the **Field** dropdown, insert one qualification question/criteria (could be employee count, annual revenue, etc.). This will direct Piper to ask for this information to qualify a lead prior to offering the meeting booker, and deflect unqualified visitors.
 - ****NOTE:** Make sure you've created the Field(s) required for this qualification criteria. (app settings > Fields)
 - Then under **Match** on the right, select Book a meeting. On the left under **No Match**, add guidance for how Piper should address unqualified prospects.
 - It should look something like this:
-

- Click **Save**, and toggle the goal **ON**. Now you have a meeting booking goal for your demos. You can adjust the qualification criteria/questions for each demo as needed based on what might be relevant to the prospect account.

- Create a **Live Chat** goal

- Create a new blank goal called something like Live Chat or Route to Rep
- Click the + sign beneath **Ask for email address**, and select **Handoff**.
- Save the goal and toggle ON. This will allow you to demonstrate how Piper can hand off to a Live Rep when relevant. (not used often, but good to have available)

Guides tab: Agent Studio contains a number of Guides that require configuring. Guides teach Piper how to engage leads dynamically by defining the messaging, tone, and priorities for specific accounts, industries, buyer personas, and even channels. They help deliver more personalized, consistent, and effective conversations that align with your business strategy.

- **Company and brand:** Add corresponding details for Informatica (or the company you're demoing as). You'll change the Company name and Description for each demo you give, so save the Description in your demo notes.

- **Guardrails, Email, Conversations, Accounts, Leads, Activities:**

- ✨ Please Reference this [Guides Best Practices document](#) for guidance populating these. Feel free to copy & paste from there as a starting point! ✨

Email tab: This is where some email-specific configuration is done.

- In the **Unsubscribe Settings**, click the dropdown next to Lead and Contact. Then select any Field on each (it doesn't have to be Email Opt Out). Then select 'is true' or 'contains opt-out' or something similar. Click Save. See below for an example. This is a required setting in order to set up Email Campaigns in Qualified!

Unsubscribe settings

Control how Piper recognizes who's unsubscribed and how people opt out of your emails.

Name

Default

Who counts as unsubscribed

Piper checks these fields before sending. Anyone who matches is treated as unsubscribed, so they won't be emailed.

Treat someone as unsubscribed when any of these rules match:

Lead ▼

Email Opt Out ▼

Is true ▼

☒ Update this field when someone unsubscribes

OR

Contact ▼

Email Opt Out ▼

Is true ▼

☒ Update this field when someone unsubscribes

+ Or

Email footer

Shown at the bottom of emails that use these settings. Include your unsubscribe plus any legal or privacy text.

If you'd like to stop receiving our emails, [unsubscribe here]{{{unsubscribe_lir

Add the link with [unsubscribe here]{{{unsubscribe_link}}}.

You can skip the Scorecard, Inbox, Pounce tabs for now!

6 Step 6: Create Experiences 6

It's finally time to start creating **Experiences**. Experiences in Qualified determine how buyers engage with

Qualified on the website through things like AI conversations and meeting booking. There are a few experiences you'll need to have ready for each custom demo. Your Piper automatic experiences may not change much from demo to demo, but you'll need to build new Meeting experiences for each demo.

Piper Experience

First, let's create your main **Piper Experience** for AI Conversations on the website.

- ✨ Check out the [Piper Experiences overview video](#) for guidance setting this up. ✨
- In **Experiences > Automatic**, create an experience called "Piper Evergreen". This will be the main website experience for your demos.
- Configure the following:
 - Show this experience to: Current page > is any page on your site (this will allow Piper to fire on any domain you've got set up to demo on).
 - Click **Add Action > Start Multi-Modal AI SDR**
 - Optionally, in the right hand menu, you can Add **messenger buttons** like 'Book a Demo' or 'Get Support' to create one-click actions for visitors.
 - Be sure to **Save** and **Toggle ON** the experience.
- From there, you can build additional Automatic Experiences if needed once you've learned the basic flow.

Meeting Booking Experiences

Next let's create **Meeting Booking Experiences** for booking meetings via Buttons and Forms.

- This is something you'll need to do for each unique company/website that you demo on. ✨ Check out the [Meeting Booking Experiences overview video](#) for guidance. ✨
- First, we'll create a **Smart Button**. This is a use case that would allow a known high value visitor to "skip the form" and book a meeting instantly.
- In Experiences, click **Buttons > Create button experience**
 - Create a meeting booking button experience on the Contact Sales or Book a Demo button following the guidance in the video above.
 - This will give you the ability to demonstrate how Qualified can offer a meeting booker and skip the form for known high value visitors.
- Now let's create a **Smart Form** to demo how a lead could book a meeting after filling out the form and being deemed qualified.
- In Experiences, click **Manual > Create manual experience**
 - On the Informatica website (or other site you're using), navigate to a Contact Sales form.
 - Right click on the Submit button, select Inspect.

- Now right click on the snippet of code that is highlighted, and navigate to Copy > Selector.
- Now navigate back to your Manual Experience, click +Smart Selector, and paste the snippet you copied into the element-id field.
- Now add “Enable meeting booking fullscreen” action.
- You’ve now created a post form-fill meeting booking experience for your demo, so the meeting booking modal will surface when you click Submit. (Make sure you turn it ON).

7 Step 7: Create Email Campaigns 7

Email Campaigns let you create and send personalized, dynamic email outreach to buyers directly from Qualified. There are an array of use cases that Qualified can support, you’ll see a few below.

- Click the **Email** tab in the main left hand nav, select **Campaigns > Create Campaign**.
- A few of the most common campaigns that you should create are Meeting Offered Not Booked, Chat Follow-Up, Event Follow-Up, and Content Download Follow-Up. Build these campaigns by filling in the required fields and settings in the UI.
- ✨ Here’s a brief [video overview](#) that will be helpful as you create a few Email Campaigns. ✨
- **NOTE:** Make sure you turn the Campaigns to **ON** so you can send yourself demo emails.
- Within a Campaign you can click Preview to see an example of what it might look like.

8 Step 8: Create Offers 8

Qualified **Offers** are personalized website experiences that display targeted messages, content, or CTAs based on visitor attributes, behavior, CRM data, and intent signals. Depending on your demo, you may want to show an example of an Offer.

We’ll build out two different examples to start. Here’s an overview video that might be helpful.

✨ Here’s a quick [overview video](#) and [University Article](#) with more detail if needed! ✨ (You may need to create a login to access University)

Let’s start with a **Header** offer for a webinar or event.

- Navigate to **Website > Offers > New Offer**
 - Under Segment, select Custom audience. Then Current Page is any page.
 - Now click Add parameters, and add something like o=1. This will allow you to trigger the banner offer when o=1 is in the URL as a parameter.
 - Under Display conditions, add Contains https://informatica.com (or your target domain)
 - Add other details.
 - In the Design tab, design your Header offer for Informatica (or the prospect you’re using).

Now do the same thing but with a **Sidepop** Offer promoting a relevant case study.

- Make sure you follow the same steps for Segment, Parameters, etc. as we did above so that your Offers appear at the right time when you're demoing.

9 Step 9: Create Workflows 9

Workflows are Qualified's automation engine, allowing you to trigger actions based on buyer behavior, conversation events, CRM updates, and more. They help connect Qualified with other systems, streamline repetitive tasks, and ensure buyers receive timely, consistent experiences without manual effort.

Let's set up a couple workflows to show off on your demos.

- Navigate to **App Settings > Workflows > Create new workflow**.

Example 1:

- **Trigger:** Meeting Booked
- **Actions:** Push to External System (Salesforce), Add to Salesforce Campaign

Example 1:

- **Trigger:** Conversation started with an AI SDR
- **Actions:** Add to Salesforce Campaign, Create a task in Salesforce, Set visitor field Lead Source to AI SDR Conversations

You can create additional Workflows using the Trigger >> Actions flows.

10 Step 10: Setup Chrome Extensions 10

Now that your demo org is built out, it's time to put things into action so you can deliver custom demos! We use a couple of key Chrome extensions to demo Qualified on prospect websites.

Qualified Chrome Extension Setup

The Qualified Chrome extension allows us to show Qualified on a prospect's website and simulate what it would look like without actually installing a JavaScript snippet on their site. The extension is also what "hides" a production instance of Piper so we can use our demo version, like on [informatica.com](https://www.informatica.com).

1. Install the [Qualified Chrome Extension](#).

✨ Check out this [overview video](#) for installing the Qualified Chrome Extension. ✨

*** ⚠️ **NOTE:** You must be logged in to your Salesforce Google Chrome profile in order to access this extension. If you're logged in and still can't open or see the above link, reach out to the Qualified team to get

added to the approved group in Google. ⚠️

2. After installing, go to **Manage Extension** and check the settings for "Allow User Scripts" and "Allow in Incognito"
3. Open the extension by clicking the Qualified extension icon, then click **Add configuration**.
4. Find the token in your Qualified demo instance by navigating to Settings > Setup. Under the section titled 'JavaScript Snippet', look for the part of the URL that says token=xyz and copy the token itself.

JavaScript snippet

Paste this snippet just before the end of the `</head>` section on your website.

```
<!-- Qualified -->
<script>
(function(w,q){w['QualifiedObject']=q;w[q]=w[q]||function(){
(w[q].q=w[q].q||[]).push(arguments)}})(window,'qualified')

</script>
<script async src="https://js.qualified.com/qualified.js?
token=B1HvLJyfBQfCh5ZQ"></script>
<!-- End Qualified -->
```

5. Click edit next to your configuration on the Qualified chrome plug-in.
6. Paste the token you copied from the previous step into the **team token** field.
7. Type **app.qualified.com** in the Qualified App Host field.
8. Add the URL for websites you want to demo on in the **target website** section of the extension and make sure it's turned on.
 - a. It can either be in the format of: "www.informatica.com" or "informatica.com", you can add both to be safe.
9. Lastly, under "Blocked Assets (Regex)" paste the following: `content/dam/informatica-com/qualified` and check the boxes for "script" and "stylesheet".
10. Save the extension and refresh the page you're on!

Stylebot Chrome Extension Setup

Now let's set up the Stylebot extension. Stylebot is a tool we use to hide other chat tools on prospect websites so we can demo Piper.

1. Install the [Stylebot Chrome extension](#):

✨ Check out this [overview video](#) for installing the Stylebot Chrome Extension. ✨

2. Make sure you have Stylebot configured to hide competitors by doing the following
 - a. Click the **Stylebot extension > Options > Styles > New Style**
 - b. Where it says 'Enter URL' put an asterisk * to apply this style to all websites.
 - c. Copy & paste the following text:

```
#intercom-container, #intercom-frame, .intercom-lightweight-app, #drift-widget, .drift-conductor-i
#nGageLH, #ngageChatDiv, .liveChatFloatingButtonSpacer, .liveChatFloatingButton, #hbl-live-chat-wr
```

```
#iframe-designstudio-button, #_hjRemoteVarsFrame, .exceed-webchat-container, .back-to-top, #ot-sdk
.slideout, #PureChatWidget, .cx-widget, .ae-right, #quickContactLink, .desktopContact, .ld-chat-bo
._hj-1tTKm__styles__surveyContainer _hj-3QsYe__styles__positionLeft _hj-3BmV5__styles__openingAnim
.roi-widget, #roi-widget, .b-envelope, #b-envelope, .launcher, #launcher, .qa-website-app, #qa-web
.insent-popup-content, #insent-popup-content, .insent-chat-widget, #insent-chat-widget, .LPMcontai
.apexchat_prechat_invitation_wrapper, #apexchat_prechat_invitation_wrapper,
.c-neat-lc__wrapper {display: none!important;width: 0px;} div[id="mutiny-preact-75b4ff0e-805e-42ec
display: none!important;} true-popup[class="amcs-popup"] {display: none!important; width: 0px;} if
display: none!important;} a [title="Get a Quote"] {display: none!important;} section.elementor-sec
display: none!important;} div.top-blue-alert-bar-copy {display: none!important;} #accessibleAccess
access-widget-ui.notranslate {display: none!important;} div.lhnHocChatBtnCont {display: none!impor
#CV-button-frame {display: none!important;} #be-messenger {display: none!important;} button.open-b
#v3734_7dc26addx4adbx4d94x8327xb985218c2551calltoactionbutton {display: none!important;} span.head
div.position-absolute {display: none!important;} access-widget-ui.notranslate {display: none!impor
#widget-container > div.MuiBox-root.mui-0 > button > img {display: none!important;} #warmly-widget
#bubble-prompt {display: none!important;} [id*="b_xct6z7sy_"]{display: none!important;} #talkative
html body ivas-messenger-ui { display: none!important;} div.bg-amethyst { display: none!important;}
iframe[id="cf_7cfb9150fdb376407dc27d70e527180c12dc724e"] {display: none!important;}
iframe[id="web-messenger-container"] { display: none!important;} iframe[id="tidio-chat-iframe"] {d
display: none;} iframe[id="icChatButton"] {display: none!important;}
iframe[id="embeddedMessagingFrame"] {display: none!important;} iframe[title*="Button to launch mes
{ display: none;}

```

a. Now create a **second Style** in Stylebot

- i. In the 'Enter URL' box add app.qualified.com
- ii. In the body, copy & paste the following:

1.

```
#cartile-ClearbitReveal, #cartile-Marketo, #cartile-Demandbase, #cartile-Salesloft
.css-1x14u6i-OutreachOwnershipDestination-xSmall-secondary-OwnershipDestinationSty
[class*="StatusBubble"], #teamReportsList, [class*="Toasts"], [class*="ActiveTimeF
[class*="ThumbnailImage"] { content:url("https://i.imgur.com/KvcGnN8.png");
display: inline-block;
height: 160px;} */[clas*="Recipient"]{display: none;}
[class*="CardHeader-MailingCard"]{display: none;}
[data-se-id="status-bubble-website-in-view-no-activity"] {display: none;}
.card-container-div.unrouted {background-color: #FFF;}
/* outreach/salesloft card color in visitor360
[class*="CardHeader-MailingCard"]{ display: none;} [class*="Card-MailingCard"] {
background-color: rgb(6, 73, 46); padding-top: 20px;} */
div.css-1km5iby-Styles-xSmall-bold {display: none;}
.table-cell div[direction="row"] {display: none;}
div[class*="-LeftPanel"] div[class*="-Panel"]:not(:first-child) {display: none;}
.table-row > div:first-child img[class*="Avatar"] { display: none;}
.table-row > div:first-child span[class*="Placeholder"] { display: none;}
div[class*="TitlePanel"] img[class*="Avatar"] { display: none;}
div[class*="TitlePanel"] span[class*="Placeholder"] { display: none;}

```

11 Step 11: Test Everything 11

The final step in your demo account setup is testing that everything you have configured up to this point is working order!

1. Visit one of your target websites to make sure you're seeing Piper engage. Ask her questions to check her responses.
2. Test your Meeting Booking button and form experiences and Offer(s).

If Piper isn't working, make sure you have an Automatic Experience with "Current Page > Is Any Page on Your Site". Make sure the Piper and Meeting Experiences are toggled ON. Make sure the correct website is listed in Target Websites in your Qualified Chrome extension.

If you need help troubleshooting, please reach out or attend office hours!

If everything looks good, you're ready to move on to the **Custom Demo Build Process**!

PART 2: CUSTOM DEMO BUILD PROCESS

 **NOTE:** If you're starting this section, you should have already completed your [Demo Account Setup](#) above. If you haven't, please go back to the previous section and complete all steps.**

Now that your demo org is configured, this section will focus more specifically on prepping everything for a custom demo tailored to a specific prospect.

For the sake of learning to build & deliver a custom demo, we'll use Informatica as the example prospect website here. Feel free to use a different prospect account if desired. The steps you follow will be very similar for future custom demos that you build, though you will tweak and tailor each one to their specific needs and criteria.

1 Step 1: Initial Setup 1

There are a few general things that you need to configure for each custom demo. You'll find them listed below.

Chrome Extension:

- In the **Qualified Chrome Extension**, you should already have a configuration set up. Click **Edit**, and add **www.informatica.com** and **informatica.com** under Target websites. (Return to [step 10](#) in the Demo Account Setup guide if you haven't configured this yet!)

- This is what allows the experiences you build in your demo org to show up on the Informatica website.
- **NOTE:** For future demos, you can simply add additional target websites, you do NOT need to add an entire new configuration or delete other websites.

In-App Setup:

- In **Qualified > App Settings > Setup** add **informatica.com** to the Website domains list.
 - This is what allows things like Offers to trigger on their website. For each custom demo, you need to add the prospect website to this list.

Theme:

- In **Qualified > Organization > Themes** create a new Theme to match the Informatica branding. Make sure to include at least the following:
 - **Global theme styles**
 - Theme name: Informatica
 - Primary Color: Use color picker chrome extension to match the orange on their website.
 - Display on domains: informatica.com (NOTE: Make sure you hit enter after typing informatica.com)
 - **Multi-Modal Messenger**
 - Starting Position: Open
 - Opened Position: Pinned
 - English disclosure: type "Privacy Policy"
 - **Classic Messenger**
 - Title: Informatica
 - English disclosure: type "Privacy Policy"
 - **Meetings**
 - Choose background color
 - English disclosure: type "Privacy Policy"
- **NOTE:** For future demos, you can simply Duplicate and edit this Theme instead of starting from scratch

each time.

2 Step 2: Create a Demo Persona 2

When demoing Qualified, we strive to make them as personalized and relevant as possible. Part of this is telling the demo story through the lens of a realistic buyer for each prospect.

- Identify a realistic prospect persona for your demo based on who the company sells to. This will be the person whose journey you show during the demo.
- Add that persona as a Lead or Contact to the Salesforce org that is connected to your Qualified demo org with at least Name, Email, Job Title, Account Name populated.
 - **NOTE:** In order to get Piper to send you demo emails, the lead/contact you use must exist in Salesforce.
 - **NOTE:** You can use a dummy email address for your demo persona, but make sure you keep track of their email address in your demo notes so you can use it in your demo when Piper asks for your email to book a meeting.
- When you deliver a demo, using URL parameters can be a great way to make the demo extra personalized and relevant. Here are the two parameters we most commonly use:
 - https://brex.com/?q_domain=t-mobile.com > In this example, I'm demoing to Brex, and my persona is someone from T-Mobile. I'd start my demo with this parameter which would tell Qualified that the visitor is from Verizon, so that Piper can show proactive identification and personalize the engagement.
 - <https://brex.com/?email=ldouglas+tmobile@salesforce.com> > In this example, Piper would know exactly who I am based on the 'email=' parameter. This assumes that a Lead or Contact is created in Salesforce that matches this email. This allows you to show the experience of a known, cooked visitor on the website for things like skipping forms.

3 Step 3: Edit Agent Studio Details 3

Agent Studio is where you set up and configure Piper. You should have already populated most of Agent studio in step 5 of Demo Account Setup. If not, return and complete that step.

There are only a couple things you may want to change for each custom demo:

- **Content tab:**
 - Crawl relevant sections of the prospect website for your demo. This creates Piper's knowledge base for answering questions, drafting emails, etc.
 - If using Informatica as an example, I'd suggest pages like the following: (Make sure you select "The above url and its subpages" to capture the whole website section)
 - <https://www.informatica.com/products>

- <https://www.informatica.com/solutions>
- <https://www.informatica.com/use-cases>
- <https://www.informatica.com/departments>
- <https://www.informatica.com/customer-success-stories>
- Once pages have crawled, find a few relevant URLs and toggle them ON as Offers for Piper to allow her share them via chat and in email. These could be case studies, blog posts, etc.
- NOTE: If for whatever reason the website crawls are failing, you can also add text snippets or PDFs as Content as well if needed.
- Now let's upload an **Image** that Piper can share during conversations. Click Add Content and select Image. (There may be some pre-populated in your account) Piper will automatically create a relevant title and description, and when a related question is asked on the website, she will present this slide.
 - NOTE: Make sure the box is checked to 'Enable for AI use' for this image.
- **Guides** tab:
 - Company and brand: Add corresponding details for Informatica (or the company you're demoing to).
 - Changing other Guides is not required, but you can add additional custom details to Conversations guide etc. if desired.
- **(OPTIONAL) Goals** tab:
 - You can leave your goals the same across demos. If you want to adjust the Qualification Questions in your Meeting Goal that Piper asks prior to booking a meeting so they align to your prospect's business you can. For example if Employee Count is a key criteria for your prospect, you may want to show how Piper can ask that and qualify. Just make sure you've first added it as a Field in Qualified.

4 Step 4: Experiences 4

You should have already built an Evergreen Piper experience that you can use for your custom demos (if not, return to step 6 of Demo Account Setup!). Your Piper experience doesn't need to change from demo to demo, but you will need to build new Meeting experiences for each demo.

- **Piper Experience:** Should be evergreen. You can tweak things like Button titles if desired.
- **Meeting Booking Experiences:** For each custom demo you'll need to create new **Smart Button** and **Smart Form** experiences. Please review the overview video for [Creating Meeting Experiences](#) here.
 - First, we'll create a **Smart Button**. This is a use case that would allow a known high value visitor to

“skip the form” and book a meeting instantly.

- Go to **Experiences > Buttons > Create button experience**
 - Follow the video instructions above to create a meeting booking button experience on the Book a Demo or Contact Sales button.
 - This will give you the ability to demonstrate how Qualified can offer a meeting booker and skip the form for known high value visitors.
- Now let's create a **Smart Form** to demo how a lead could book a meeting after filling out the form and being deemed qualified.
- In **Experiences**, click **Manual > Create manual experience**
 - On the Informatica website (or other site you're using), navigate to their Contact Sales or Demo Request form.
 - Right click on the Submit button, select Inspect.
 - Now right click on the snippet of code that is highlighted, and navigate to Copy > Selector.
 - Now navigate back to your Manual Experience, click +Smart Selector, and paste the snippet you copied into the element-id field.
 - Now add “Enable meeting booking fullscreen” action.
 - Select the step titled “C1: Ask qualifying questions” where the email address is being captured, and delete it by clicking the red trash can in the top right corner. We want to go straight to the availability.
 - Make sure you Save and Enable the experience!
 - You've now created a post form-fill meeting booking experience for your demo, so the meeting booking modal will surface when you click Submit. (Make sure you turn the Experience ON).

5 Step 5: Offers (Optional) 5

Depending on your demo, you may want to show an example of **Offers**. Offers are personalized website experiences that display targeted messages, content, or CTAs based on visitor attributes, behavior, CRM data, and intent signals.

We'll build out two different examples for this demo. ✨ Here's a quick [overview video](#) you can review if needed. ✨

Let's start with a **Header** offer for a webinar or event.

- Navigate to **Website > Offers**
 - Create new Offer
 - Under Segment, select Custom audience. Then Current Page is any page.
 - Now click Add parameters, and add something like o=1. This will allow you to trigger the banner

offer when o=1 is in the URL as a parameter. You could also put a specific webpage or use a domain parameter to trigger the offer.

- Under Display conditions, add Contains <https://informatica.com> (or your target domain)
- Add other details.
- In the Design tab, design your Header offer for Informatica (or the prospect account you're using)

Now do the same thing but with a **Sidepop** Offer promoting a relevant case study.

- Make sure you include o=1 (or whatever your parameters are) so that your Offers appear at the right time when you're demoing.

6 Step 6: Testing the Demo Flow 6

Now let's walk through a basic demo flow to test that everything works properly.

- Open a new incognito window (Command+Shift+N).
- Go to your starting URL. For example, https://informatica.com/?q_domain=t-mobile.com
- Ensure that the correct URL parameters are coming through (such as q_domain= or email=) and that they're properly informing Piper of the visitor's Company, and also triggering Offer(s) as appropriate.
- Engage with Piper via text and voice to ensure she's answering questions appropriately. Test the specific questions you plan to ask in the demo.
- Ask a question to test out Image sharing and ensure Piper is presenting the content appropriately. Make adjustments in Agent Studio > Content / Guides as needed.
- Request a meeting or ask for Pricing to test Piper's goal execution, qualification, and meeting booking within the conversation. (don't actually book meetings!)
- Confirm that the meeting booking modal appears when you click the Smart Button/Form that you've configured.
- After seeing the meeting booker, hit Command+Shift+K to kill the web session.
- Now jump to Email Campaigns and test that the Simulator is showing good email examples for your example lead.
- Test the Lead Spotlight view to ensure it looks good (Activity tab in left menu)
- Check your inbox to see if you got an email from Qualified.
 - **NOTE:** In order to get Piper to send you demo emails, the email address you give her must match a Lead/Contact in your connected Salesforce environment!

Once you're ready to build a custom demo for another prospect, you can return to these steps in Part 2: Custom Demo Build Process!

PART 3: CUSTOM DEMO FLOW & TALK TRACK

✨ If you're on to this section, you should have already completed the [Custom Demo Account Setup](#) and the [Custom Demo Build Process](#). If not, please return and complete those.

The Qualified demo can generally be thought of in three main chapters:

1. [Chapter 1](#): Piper on the Website (Front End Engagement)
2. [Chapter 2](#): Piper in the Inbox (Email Engagement)
3. [Chapter 3](#): Qualified Back End (Behind the Gear)

1 Chapter 1: Piper on the Website **1**

Click Path	Talk Track
0. Introduce the demo and level set.	Today we'll be showing a custom demo that walks through how Qualified engages your buyers dynamically right on the website, as well as with timely, contextual emails to increase conversion & quality pipeline. We'll start with the website experience.
1. Open an incognito window (cmd + shift + N) and visit the prospect website using your starting URL. <i>[NOTE: Whenever sharing your screen, DO NOT forget to share sound!]</i> 	As we come to the site you'll see Piper greeting us proactively with a contextually relevant message, working to bring us into a conversation. Piper is an AI SDR Agent that works 24/7 to engage & convert leads. Notice how Piper appears as an extension of the website – she isn't relegated to the lower right corner, hidden behind a button, or overlapping important website content. She's embedded into the website acting as an

2. Browse around the website by scrolling down or clicking to a new page.

always-on ride-along concierge.

As a visitor hits the website, Piper is also working behind the scenes to build a unique profile about this visitor. She's using browsing & intent data, as well as data we may have about this visitor from other GTM systems (like Salesforce, ABM tools, or marketing automation platforms) to personalize the experience.

So as we poke around the website, Piper is observing our digital body language, seeing what we do in real time, and using this information to then nudge us with another message.

3. Engage with Piper in Text Mode.

[Type or paste your first question in text]

Let's now take a look at how Piper can facilitate fully open-ended Q&A, serve up relevant resources, bring visitors down the funnel, and qualify & convert them seamlessly.

We'll say this buyer has some questions and is ready to engage.

I can of course have a text-based conversation with Piper if I'd like.

[type/paste question]

Since she's onboarded with all of your messaging & product information she provides a nice accurate and concise response. Also asking follow-up questions to move the conversation forward.

4. Click "Speak with Piper" and allow microphone permissions.

And text is great, but the future of agents on the website is multimodal.

So let's click Speak with Piper and take a look at how we can have a true voice and video conversation with her, just like I would a real human.

5. Ask Piper a question via voice.

[**Note:** This question should be your trigger for your slide share]

[**Note:** You will want to mute Piper in between interactions to prevent her picking up audio from conversation mid-demo. This is found underneath her picture in Pinned mode.]

6. Ask Piper something like: “We are working with our team in France on an RFP. Parlez-vous français?”

[ask a question via voice]

In this example, not only is Piper answering my question, she’s also able to present relevant content to further educate me as a buyer.

Since she’s onboarded with relevant marketing content, she’s able to pull from a library of resources and surface them as appropriate throughout the conversation.

[ask multi-lang question]

Here we see how Piper is also multilingual. She can seamlessly pivot to any language in real time to serve your global customers.

This is where an SDR agent can really scale and where a human SDR team would struggle.

A lot of my team is based in Europe, and we're working on an RFP together. I'm curious, parlez-vous français?

Oui, je parle français sans problème. Je peux continuer en français si vous le souhaitez. Sur quoi voudriez-vous qu'on se concentre pour votre RFP ?

Book a Demo

Get Support

Ask Piper a question

[Privacy Policy](#)

7. Tell Piper: "Ok, let's switch back to English. This has been helpful, I have to run soon... What can you tell me about pricing?"

[When prompted, type/paste your Demo Persona email address]

[Note: Don't actually book a meeting]

Okay, this has been really helpful, Piper. I need to run in just a minute, but what can you tell me about pricing?

Just a second. Let me check.

Pricing is highly dependent on each customer's unique situation and needs, so I can't give exact pricing here. I can connect you with an expert to walk you through the right options. Can you share your email so I can get you in touch with them? You can also type it in the chat for accuracy.

loganqdemo+jentmobile@gmail.com

Now for the sake of time, let's say this buyer has been chatting with Piper for several minutes and is ready to learn more.

[ask about pricing]

Here we can see Piper recognize a high intent question, and execute on the appropriate goal as a result. So she's moving into qualification and conversion mode, capturing the information she needs, and working to book a meeting.

8. After the Meeting Booker appears, press **CMD+Shift+K** to kill the visitor session and populate Spotlight details in the Activity Database.

This must be done outside of the Piper pinned chat, on the site, and you will see a red dot on the bottom right to indicate the session has been killed.

Once the email address is captured, Piper is immediately enriching the lead profile on the backend with data from SFDC, MAP, or other sources.

Maybe we want Piper to ask 1-2 important qualifying questions, but Piper can enrich things like Company, Job Title, etc. without having to ask.

[NOTE: After killing the session, don't interact with Piper anymore in the same incognito window or she'll treat you as if you've started a new convo]

Schedule a meeting

You'll meet with

Logan Douglas

Now let's say the buyer needs to run and doesn't end up booking a meeting.

9. Close your browser window and navigate to your email inbox.

[NOTE: You should trigger an email from Piper by simulating your demo flow beforehand. It can sometimes take a few minutes for these emails to be sent.]

This is a pivotal moment. Without agentic marketing, this lead might slip through the cracks; but with Piper, no leads slip through the cracks and the follow-up is instant.

Let's take a look at an email she might send.

2 Chapter 2: Piper in the Email Inbox 2

Click Path	Talk Track
10. Go to your Email Inbox and open the email	Here we can see an example of an email Piper

from Piper.

might send based on our high intent interaction. This email isn't generic, it's highly contextual based on our recent exchange. It references our conversion, shares relevant links, and of course includes a link to book time.

So buyers have the option to book a meeting from here in a couple clicks, maybe we want to check out one of the links Piper shared...

But I also have the option to respond to Piper's email and continue our conversation right here in the inbox.

[OPTIONAL] 11. Reply to the email.

[Type Email Response to Piper Email such as “Thanks, I’m interested in learning more, but curious about your pricing?”]

[**NOTE:** Again, it can take up to 5 minutes for Piper to respond. Recommended to trigger this before the demonstration, or come back later to show Piper's reply.]

Piper handles back and forth emails seamlessly, providing quick responses, and continually working to qualify and convert leads.

A busy rep might not be able to answer this email response right away. They're juggling a ton of conversations and priorities at once.

Piper adds scale and speed. Piper's not taking breaks, she doesn't need to pivot. She can have a real-time conversation on the website, or an async conversation with leads in the inbox - but it's all one unified experience.

12. Click one of the links from the first Piper email and open a new incognito window to arrive back on the website.

Now let's look at what might happen if we click one of these links and land back on the website. We'll see that Piper knows exactly who we are, and greets us with a personalized message referencing the recent email.

This is the magic of a multi-channel SDR agent. It's one continuous personalized experience across email and website.

13. Click one of the Smart Buttons you've created like Get a Demo.

[NOTE: Do not actually book a meeting, just show the meeting booker.]

We showed you earlier how seamlessly Piper can engage and convert visitors via conversations, but Qualified can also tie into your existing CTA buttons and forms to streamline and boost conversion.

So if we click Get a Demo, rather than taking us to a form to fill out and adding friction, since Piper already knows who we are and knows we're qualified for a meeting, she's going to skip the form entirely and fast-track us through to a meeting booker.

With just a few clicks, Piper can book a meeting with the assigned sales rep and relays all pertinent details to the account owner.

Conclusion:

Now you've seen how Piper autonomously generates pipeline for marketing teams around the clock through conversations on the website, seamless meeting booking, and contextual email follow-up.

3 Chapter 3: Qualified Back End 3

Click Path

14. Navigate to the Qualified App (app.qualified.com) and navigate to Activity at the top left.

Talk Track

Now we'll jump into the back end to show how Piper is building a Buyer Profile for each lead she interacts with, at scale.

Lead Activity serves as the home base for admins logging in, giving immediate visibility into leads and accounts, as well as key performance metric tiles such as meetings booked, offers clicked, and more.

15. Click the Demo Persona lead and open the Spotlight view

Piper's Spotlight opens the black box of AI to the Marketer, giving observability into Piper's context for each lead and the decisions she's making, not just the outcomes. You can see what Piper has done, and what she plans to do next, in real time

Spotlight makes it easier to understand why a lead didn't convert and then tune guides accordingly.

16. Click the gear on the bottom left to navigate to AI → Agent Studio → Agent Profile

Now I am going into “behind the gear” to show how Qualified’s Agent Studio gives the power back to the Marketer to be able to make changes to Agent Behavior and Actions without having to work with an Engineer.

Agent profile is where you can configure the AI SDR's identity, appearance, personality, and tone.

17. Click the Content tab and scroll to your website crawl

Content is where the Marketer has full control over Piper's knowledge base.

Piper is onboarded just like your best SDR, utilizing marketing content on your site as well as internal documentation to formulate her knowledge.

18. Click the Guides tab and click on the Conversations Tab

The basis of Piper's engagement is rooted in Guides, where a Marketer can define Agent Behavior by modality (Voice/Text), by channel (Email/Chat), and by account tier or industry (Account Guides), all in natural language.

The Conversations guide provides core natural language instruction that Piper will follow for every conversation such as when to pursue qualification, meeting booking, or deflection. A Marketer defines the style and intent, and Piper handles the rest.

The Email guide is part of the guide-based architecture that acts like a digital playbook for how Piper should run email follow-up.

Account Guides are where you tell Piper how to personalize the experience by account segment, instead of treating every visitor the same. This can be by Segment, Tier, or Industry – allowing the tone and messaging to be different.

22. Conclusion	Today I showed you a completely autonomous inbound experience with Piper, the AI SDR, both on the site and in the email inbox. This is truly agentic marketing in action, and why Qualified has over 700 live AI agents in production today.
